Passive Infrared Occupancy Sensor Module

By LTF

Description

The Passive Infrared (PIR) Occupancy Sensor Module is an infrared control product designed to detect and control low voltage (12V-24V) lighting systems. When occupants enter the detecting area, the switch will connect the load to make it work automatically. The light will stay on if there is movement in the detecting area. The light will be time-delayed off (adjustable 3-500 seconds) when there is no movement in the detecting area.
